Like most people, you've probably been building your collection of music CDs for quite a while now. Maybe they're stacked up to the ceiling. Maybe they're bulging out of numerous carrying cases. Maybe a lot of them feature only one or two songs you really like. Whatever your story, chances are you could use some help managing your music.

Just as iMovie revolutionized the way people make home movies, Apple's new iTunes music software takes the confusion out of managing your personal music collection. iTunes turns your Mac into a powerful digital jukebox, complete with easy-to-use tools for recording music from audio CDs, searching and browsing your entire music collection, downloading songs to MP3 players, and even burning your own custom CDs.* Best of all, iTunes is available as a free software download at www.apple.com/itunes for both Mac OS 9 and Mac OS X.

iTunes up close

No longer do you need the skills of a computer geek plus the patience of a saint to manage your music collection. Rather than making you use several applications, iTunes lets you collect, browse, organize, and burn your favorite music onto CDs with one simple, intuitive application.

When you insert a music CD, iTunes immediately checks the comprehensive CDDB (Gracenote) database on the Internet to identify the artist, title, and track list for your iTunes library. iTunes imports your music as high-quality MP3 files, so your music not only sounds great, it also takes up far less space on your hard drive. Your MP3 songs are stored in a centralized, easily searchable library, and you can drag your music selections from the library into personalized music playlists. It's all easy, quick, and convenient.

iTunes also turns your Macintosh into a great-sounding radio that keeps your ear on the world beat. With iTunes, you can access MP3 streaming audio and listen to hundreds of popular Internet radio stations playing all kinds of music, as well as news and sports. Once you find a station you like, you can drag it into a playlist where you can easily access it later.

Listen to your music on your Macintosh, or with iTunes and an MP3 player, take your favorite music for a jog. iTunes has built-in support for popular MP3 players such as the Rio and Nomad, so you can easily download selections to take on the run. If your Mac has an Apple CD-RW drive or a supported third-party CD-RW drive, iTunes enables you to create your own custom music CDs featuring your favorite songs.* The oh-so-simple iTunes user interface makes CD burning a breeze. When you burn CDs, iTunes shows you what fits and what doesn't—no more cutting a song short, right in the middle of the guitar solo.

iTunes works fast, always burning your custom CDs at the top speed of your CD-RW drive. Even better, with iTunes you can burn your CDs while you continue to use your Mac to do whatever else you want, like surf the Net or answer your email. iTunes is accelerated for PowerPC G4 processors with Velocity Engine and supports dual processor systems for even faster performance. That's what we call a cool burn.
